

I obtained this great tool from Boring Research about a month ago and have been using it since then. I find that it has reduced my frustration with cutting tool clean up in my shop greatly. I love to use my tools to make many different items but always dreaded the time it would take to clean up my tools, especially the Mill and Lathe. On my Lathe a lot of the framing connectors are countersunk set type bolts (pictures under separate cover). Cleaning these areas up created more of a mess when using compressed air to clean them out. With the Magnetic Pickup tool I can clean them out quickly and with out spraying all of the fines all over the place. I have used this tool in other areas of my shop as well, where it is not easy to get to. I continue to find uses for it most every time I'm working in the shop. My biggest problem is finding it when I need it, probable should invest in a couple of them.
